

# RECLAIM PRIVACY WITH NEW PARTITIONS

Configurations can vary - it is mainly dependent on how much traffic the restroom will receive. Smaller restrooms normally have 3 toilet stalls (2 standard & 1 handicap) and if it's a men's room will contain 1 or 2 urinals. However, they can go up to 15 stalls on each side of the door (for a high school football restroom).

## **Partition Types:**

**Standard:** This is the kind you normally see with a 12" gap at the bottom and sightlines at the door edge.

**European:** These are basically little rooms, with a much smaller gap at the bottom (for wheelchair foot movement) but no sightline gaps at all. Most times the bathroom partitions connect to the ceiling however they don't always, when they don't they are much higher than standard partitions.

**Single use rooms:** These are completely enclosed rooms, with no gaps or sightlines, however where you will see these most commonly are in one toilet restrooms where it's more like a bathroom in your home than a public restroom.

## **Materials:**

Partition material has come a long way, from the wooden structures, brick, powder coated steel and solid plastic. The newer types of toilet partitions are more durable, waterproof in some cases have more ability to customize for various locations.

- Powder Coated Steel
- High Pressure Laminate
- Solid Plastic (HDPE)
- Stainless Steel
- Solid Phenolic
